

IN THE ABSTRACT

Cancel the Abstract of the Disclosure in its entirety and add the following new Abstract.

--For an analytical apparatus in which a plurality of reagent manufacturers are involved, reagent set up is implemented by incorporating steps in which reagent-dependent parameters of the required reagents of a plurality of reagent manufacturers are stored in batch form on a storage medium. The batch-stored reagent-dependent parameters corresponding to the analytical apparatus specifications are registered in the analytical apparatus by use of the storage medium. A series of data measurements based on the batch-registered reagent-dependent parameters are performed using the required reagents.--
